

II. CLAIM AMENDMENTS

1. (currently amended) A method of locating a subscriber terminal in a packet-switched radio system, comprising:

the core network of the radio system transmitting a location service request message to the radio network of the radio system;

the radio network transmitting information to the subscriber terminal in a paging message that the subscriber terminal is requested to initiate the location service;

the subscriber terminal that received the paging message transmitting a paging response message to the radio network;

the radio network transmitting the paging response message to the core network; and

locating the subscriber terminal on the basis of the information included in the paging response message, wherein said information comprises identity of a serving cell and other information ~~useful in location determination.~~ comprising at least one of complete location estimate, cellular interface signal strength measurements, timing information of the radio connection relating to location, and measurements based on sources unrelated to a radio connection.

2. (cancelled)

3. (original) A method according to claim 1, wherein the information further comprises at least one of the following parameters: receiving power of the serving cell, receiving power of at least one neighboring cell, charge level of the battery in

the subscriber terminal, information on the conditions at the location of the subscriber terminal, information on a previous location of the subscriber terminal.

4. (original) A method according to claim 1, wherein at least part of the information included in the paging response message received by the core network has been inserted into the paging response message by the subscriber terminal.

5. (original) A method according to claim 1, wherein at least part of the information included in the paging response message received by the core network has been inserted into the paging response message by the radio network.

6. (previously presented) A method according to claim 1, wherein the subscriber terminal initiates the location service after it has received the paging message.

7. (original) A method according to claim 6, wherein the functions required by the location service comprise receiving signals in the subscriber terminal and measuring them, or transmitting signals from the subscriber terminal.

8. (original) A method according to claim 7, wherein the signals received in the subscriber terminal for implementing the location service comprise signals transmitted by the radio system, including signals transmitted by other base stations of the radio system than by that of the serving cell, or the signals transmitted by a satellite of the GPS system.

9. (original) A method according to claim 6, wherein the subscriber terminal continues performance of the functions

required by the location service after it has transmitted the paging response message.

10. (previously presented) A method according to claim 1, wherein the network part checks whether the location of the subscriber terminal carried out corresponds to a target set for the quality of service.

11. (original) A method according to claim 10, wherein, if the target set for the quality of service is not achieved, the network part will perform a location service which offers a better quality of service.

12. (original) A method according to claim 1, wherein the paging message is transmitted even though the subscriber terminal would already be on standby due to a paging message received earlier.

13. (original) A method according to claim 1, wherein the paging message and the paging response message are messages of protocol layers that correspond to the third layer of the OSI model.

14. (currently amended) A packet-switched radio system comprising:

- a network part of the radio system, which comprises a core network, and a radio network connected to the core network;

- a radio connection from the radio network to a subscriber terminal;

- the network part comprising location service means for locating the subscriber terminal;

the network part comprises means for transmitting a location service request message to the radio network;

the radio network comprises paging means for transmitting information to the subscriber terminal in a paging message that the subscriber terminal is requested to initiate the location service;

the subscriber terminal comprises means for transmitting a paging response message to the radio network after it has received the paging message;

the radio network comprises means for transmitting the paging response message to the core network; and

the network part of the radio system comprises means for locating the subscriber terminal on the basis of the information included in the paging response message, wherein said information comprises identity of a serving cell and other information ~~useful in location determination.~~ comprises at least one of: complete location estimate, cellular interface signal strength measurements, timing information of the radio connection relating to location, and measurements based on sources unrelated to a radio connection.

15. (cancelled)

16. (previously presented) A radio system according to claim 14, wherein the other information comprises at least one of the following parameters: receiving power of the serving cell, receiving power of at least one neighboring cell, charge level of the battery in the subscriber terminal, information on the

conditions at the location of the subscriber terminal, information on a previous location of the subscriber terminal.

17. (previously presented) A radio system according to claim 14, wherein the subscriber terminal comprises means for inserting at least part of the information, included in the paging response message received by the core network, has been inserted into the paging response message by the subscriber terminal.

18. (original) A radio system according to claim 14, wherein the subscriber terminal comprises means for inserting at least part of the information included in the paging response message received by the core network has been into the paging response message by the radio network.

19. (previously presented) A radio system according to claim 14, wherein the subscriber terminal comprises means for initiating the location service after it has received the paging message.

20. (original) A radio system according to claim 19, wherein the functions required by the location service comprise receiving signals in the subscriber terminal and measuring them, or transmitting signals from the subscriber terminal.

21. (original) A radio system according to claim 20, wherein the signals received in the subscriber terminal for implementing the location service comprise signals transmitted by the radio system, including signals transmitted by other base stations of the radio system than by that of the serving cell, or the signals transmitted by a satellite of the GPS system.

22. (original) A radio system according to claim 19, wherein the subscriber terminal comprises means for continuing the functions required by the location service after it has transmitted the paging response message.

23. (previously presented) A radio system according to claim 14, wherein the network part comprises means for checking whether the location of the subscriber terminal carried out corresponds to a target set for the quality of service.

24. (original) A radio system according to claim 23, wherein, if the target set for the quality of service is not achieved, the network part comprises means for performing a location service which offers a better quality of service.

25. (original) A radio system according to claim 14, wherein the paging means transmit a paging message even though the subscriber terminal would already be on standby due to a paging message received earlier.

26. (original) A radio system according to claim 14, wherein the paging message and the paging response message are messages of protocol layers that correspond to the third layer of the OSI model.

27. (new) The method according to claim 1, wherein the timing information of the radio connection comprises a timing advance factor or the round trip time.

28. (new) The method according to claim 1, wherein the paging method further includes a cause code indicative of the reason for which the subscriber terminal is being located.

29. (new) The radio system according to claim 14, wherein the timing information of the radio connection comprises a timing advance factor or the round trip time.

30. (new) The radio system according to claim 14, wherein the paging method further includes a cause code indicative of the reason for which the subscriber terminal is being located.
